

Design System

Colour, type, space, motion and components for the Prayana product — the web system and its React Native port, plus the one rule that settles which teal is actually the brand.

travel-ai-nextjs · Next.js · Tailwind · Sources: COLORS.txt · TYPOGRAPHY.txt · prayana-logo.svg

1 SOURCE OF TRUTH

The logo defines the brand — not COLORS.txt

The Prayana logo (`public/prayana-logo.svg`) is the canonical brand palette: **teal is primary, red is secondary**.

The ramps documented in `COLORS.txt` (teal `#2EC4B6` / yellow `#FFE66D` , coral `#FF6B6B`) predate that call and diverge from the logo. They remain accurate as a description of what the *Tailwind config* is wired to — they are implementation tokens, not the brand.

When the two disagree, **the logo wins**.

BEFORE YOU SWAP ANYTHING

Many components are bound to `primary-500` / `#2EC4B6` / `#0D9488` . A blanket find-and-replace will break visual consistency. New brand surfaces should use the logo values; existing ones get migrated deliberately, not in bulk.

2 BRAND PALETTE

Canonical — taken from the logo

PRIMARY

#4AC0CC

Teal

Brand surfaces, primary CTAs, hero accents.

SECONDARY

#E61417

Red

Secondary accents, badges, urgent states. Small areas only — never a wide background.

Supporting logo colors

Drawn from the logo's gradients. Use sparingly, on logo-adjacent surfaces only.

GRADIENT

#EC2D28

Red gradient stop

FLAME

#FB923C

Orange flame

GRADIENT

#FAF578

Yellow stop (light)

GRADIENT

#F9D84F

Yellow stop (deep)

3 LEGACY DESIGN-SYSTEM TOKENS

What the Tailwind config is actually bound to

These are real and in use across the codebase. Treat them as implementation detail, not brand identity.

primary — teal ramp **bg-primary-500**

secondary — yellow **#FFE66D** · **accent — coral** **#FF6B6B**

SECONDARY-500

#FFE66D

Highlights, stars, icon accents. Fails contrast for text — never set body copy in it.

ACCENT-500

#FF6B6B

Destructive and "Enquire" CTAs, favourites. Reserve for urgent intent, not decoration.

4 SECTION THEMES

Areas of the product that deliberately depart from teal

Each of these is an explicit product decision. Don't "correct" them back to the brand teal.

AREA	PALETTE	VALUES	NOTES
Admin <code>/admin/*</code>	Dark blue	<code>#1E3A8A</code> <code>#1E40AF</code> <code>#1D4ED8</code>	Tokens in <code>admin-tokens.css</code> . Use <code>---ax-accent-via</code> , never <code>indigo/violet/purple</code> .
eSIM <code>/esim/*</code>	Red	<code>#E61417</code>	Red <code>esim-gradient</code> themed, not teal. Match <code>EsimPlanCard</code> conventions.
Create trip logged-out landing	Blue-led, red accent	<code>#2563EB</code> <code>#1D4ED8</code> <code>#DC2626</code>	Icon tiles <code>from-blue-600 to-blue-700</code> . Red only on step badges & accents. Never <code>blue-500 / sky / indigo</code> on solid fills.

5 NEUTRALS

A slightly warm custom gray ramp

ROLE	LIGHT	DARK
Page background	<code>bg-gray-50</code> · <code>#FAFAFA</code>	<code>bg-black</code> · <code>#000000</code>
Card / surface	<code>bg-white</code> · <code>#FFFFFF</code>	<code>bg-dark-card</code> · <code>#080808</code>
Primary text	<code>text-gray-900</code> · <code>#181818</code>	<code>text-white</code>
Secondary text	<code>text-gray-600</code> · <code>#52525B</code>	<code>text-white/60</code>
Muted / meta	<code>text-gray-500</code> · <code>#71717A</code>	<code>text-white/40</code>
Borders	<code>border-gray-200</code> · <code>#E4E4E7</code>	<code>#0D0D0D</code>

6 DARK MODE

Calm & minimal — pure black base, restrained glow

bg **surface** **card** **border**

TOKEN	VALUE	USE
<code>dark.text.primary</code>	☐ <code>#FFFFFF</code>	Primary text
<code>dark.text.secondary</code>	☒ <code>#A0A0A0</code>	Secondary text
<code>dark.text.muted</code>	☒ <code>#666666</code>	Captions, meta
<code>dark.accent.secondary</code>	☒ <code>#8B5CF6</code>	Premium badges
<code>dark.accent.success</code>	☒ <code>#10B981</code>	Success states
<code>dark.accent.warning</code>	☒ <code>#F59E0B</code>	Warnings

Bright gradients collapse to a flat start-color fill in dark mode. Keep it that way.

7 TYPOGRAPHY

The native system stack is the brand typeface

No webfont is loaded for the product shell. Plus Jakarta Sans is scoped to the Itinerary UI only. The app uses the default Tailwind type scale — no custom `fontSize` extension.

Heading hierarchy

`text-4xl sm:5xl md:6xl`
`font-black tracking-tight`

Plan a trip in minutes

`text-3xl sm:text-4xl`
`font-black tracking-tight`

Explore India

`text-2xl md:text-3xl`
`font-bold`

Popular destinations

`text-xl font-semibold`

Where to stay

`text-lg font-semibold`

Nearby experiences

`text-base font-normal`

Body copy sits at sixteen pixels and stays near sixty-five characters per line so it never tires the eye.

`text-sm text-gray-600`

Secondary body — supporting detail and helper text.

`text-xs font-medium`

Caption · metadata · pills

`text-xs font-bold`
uppercase
tracking-widest

EYEBROW LABEL

Weights

WEIGHT	CLASS	USE
400	<code>font-normal</code>	Body copy
500	<code>font-medium</code>	Captions, secondary labels
600	<code>font-semibold</code>	Subheads, H3/H4, buttons
700	<code>font-bold</code>	Headings, CTAs, numbers
800	<code>font-extrabold</code>	Section titles
900	<code>font-black</code>	Display, hero, statistics

SCALE DRIFT

The codebase carries 700+ arbitrary pixel sizes — `text-[9px]` , `text-[11px]` , `text-[13px]` , `text-[15px]` . They short-circuit the scale and cause visual drift. Stay on the canonical Tailwind steps. The single sanctioned exception is the micro label: `text-[10px]` uppercase `font-bold` .

8 SPACE, RADIUS & ELEVATION

A 4-point grid

STEP	VALUE	RADIUS	VALUE
space.1	4	<code>radius.sm</code>	4
space.2	8	<code>radius.md</code>	8 – buttons, inputs
space.3	12	<code>radius.lg</code>	12
space.4	16 – default card padding	<code>radius.xl</code>	16 – cards
space.6	24	<code>radius.2xl</code>	24
space.8 / 12 / 16	32 / 48 / 64	<code>radius.full</code>	9999 – pills

Elevation

Three steps plus an accent glow. On mobile these become iOS `shadow*` props and Android `elevation` — a web `box-shadow` has no direct RN equivalent.

TOKEN	USE	RN ELEVATION
<code>shadow.sm</code>	Resting cards, inputs, secondary buttons	1
<code>shadow.md</code>	Raised cards, popovers	3
<code>shadow.lg</code>	Modals, sheets	8
<code>shadow-glow</code>	Primary CTA — accent-tinted glow	web only

Dark mode uses the same geometry at higher opacity (0.5 vs 0.1) — darkness, not lightness, carries depth on a black ground.

9 MOTION

One curve, three speeds

TOKEN	VALUE	USE
<code>ease</code>	<code>cubic-bezier(0.32, 0.72, 0, 1)</code>	Every transition. A decisive ease-out — fast to start, soft to land.
<code>duration.fast</code>	120ms	Hover / press feedback, color changes
<code>duration.base</code>	180ms	Cards, layout shifts, most transitions
<code>duration.slow</code>	320ms	Modals, sheets, entering surfaces

RESTRAINT

Motion confirms an action; it doesn't decorate. If an animation isn't reporting a state change, cut it. Always honour reduced-motion.

10 COMPONENTS

Sizes are shared across web and mobile

Button

SIZE	HEIGHT	PADDING X	TEXT	GAP
sm	32	12	12	6
md	36	16	14	8
lg	44	20	14	8

Radius 8 · weight 600 · icon 16 · disabled opacity .5 . Variants: **primary** (CTA gradient + glow), **secondary** (surface + border), **ghost** (transparent), **danger** (solid coral).

Input · Badge · Card

COMPONENT	SPEC
Input	<code>h 40</code> · <code>radius 8</code> · <code>text 14</code> · <code>padX 14</code> (40 with icon) · <code>icon 16</code> @ left 12
Badge	<code>radius 6</code> · <code>padX 8</code> · <code>padY 2</code> · <code>text 11</code> / 600 · <code>soft</code> = 12% tint fill + 25% ring
Card	<code>radius 16</code> · <code>padding 16</code> · <code>surface bg</code> · <code>1px border</code> · <code>elevation 1-3</code>

Badge intends reuse the semantic colors — `neutral` · `brand` · `success` · `warning` · `danger` · `info` — always as a 12% tint with a 25% ring, never a saturated fill (except solid) .

11 MOBILE — REACT NATIVE

Where the web idiom doesn't survive the port

The mobile theme mirrors every token above. Four things could not be copied verbatim — they are already handled in `theme.ts` , so don't "fix" them back.

WEB	REACT NATIVE	WHY
<code>letter-spacing: -.025em</code>	<code>letterSpacing: -.075</code>	Web tracking is <i>relative</i> ; RN is in absolute points. Computed per style as <code>em × fontSize</code> .
<code>box-shadow</code>	<code>shadow*</code> + <code>elevation</code>	No RN equivalent. iOS uses shadow props, Android needs <code>elevation</code> . Both are emitted.
<code>:hover</code>	<code>Pressable</code> → <code>pressed</code>	Phones have no hover. Press feedback is <code>opacity .85</code> .
<code>h-8 (32pt) button</code>	<code>hitSlop</code> → 44pt	iOS wants ≥44pt, Android ≥48dp. The <code>sm / md</code> buttons are below that; <code>hitSlopFor()</code> grows the tap area without changing the visual size.

ANDROID FONT WEIGHTS

Numeric `fontWeight` above 700 only renders where the system font exposes those cuts. Roboto on Android 9+ does; older devices fall back to bold. Since the scale leans on 900 for Hero and H1, ship a variable font if guaranteed black weights matter.

12 DO & DON'T

The short version

Do

- Anchor new brand surfaces on the logo values — teal `#4AC0CC` primary, red `#E61417` secondary.
- Use the gray ramp for structural UI: text, borders, backgrounds.
- Use CSS variables (`---text-primary` , `---surface` , `---border`) when a component must adapt to both themes.
- Keep red to small accents — badges, urgent states, thin rules.
- Respect the section themes: admin is dark blue, eSIM is red, create-trip is blue-led.

Don't

- Don't hard-code hex like `text-#009488` where a token exists — use `text-primary-600` .
- Don't mix teal and coral in one CTA. One intent per surface.
- Don't set text in `#FFE66D` — it fails contrast. Icons and highlights only.
- Don't use bright gradients in dark mode. Flat fills.
- Don't bulk-swap `primary-500` to the logo teal — migrate deliberately.
